Resizing photos using http://www.picmonkey.com/ :

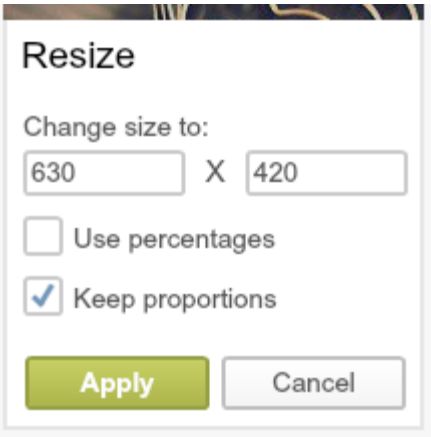

1. Click “Edit” at the top of the page, and it will prompt you to select a photo from your computer to edit.

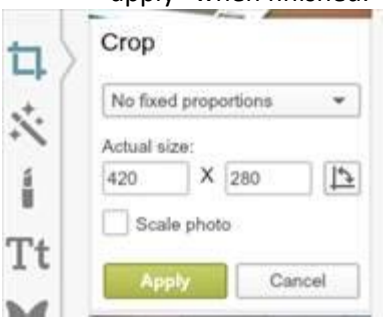

2. If you want to resize the photo, select the “resize” option on the left. Make sure “keep proportions” is checked, and enter your dimensions. When you enter one of the dimensions, the other will automatically calculate based on the original proportions of the photo. If the number that is automatically calculated ends up being lower than desired, enter the desired number in that blank. This will cause the other dimension to be larger than desired, but that is okay. You can crop it to be smaller, but you can’t crop it to be larger. (For example, if you are trying to resize your photo to be 765 px by 420 px, the situation in the second image is fine, because you entered 765 in the first blank and the proportional dimension is 510. However, in the third image, if you entered 420, the proportional number is 630, which is too small.) Click apply when finished.

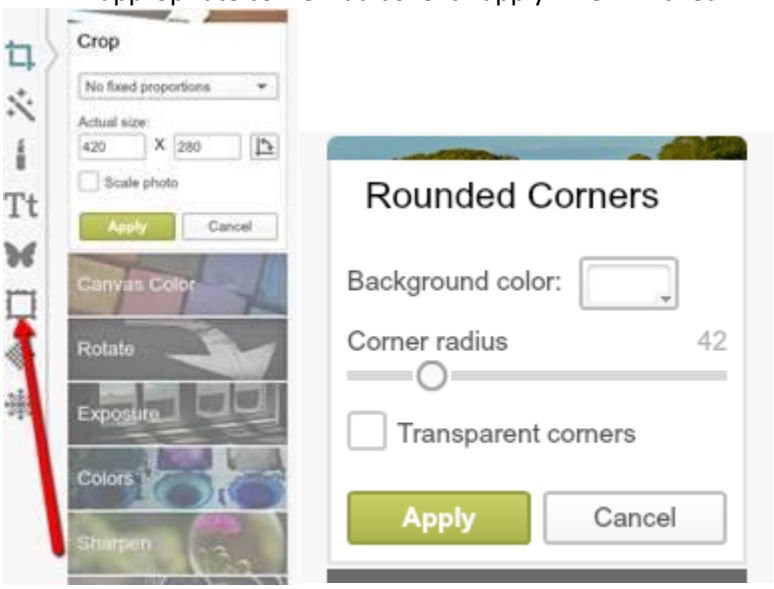

3. To crop the photo, select “crop” from the menu on the left, and choose the size you would like to make the photo. Make sure “No Fixed Proportions” is selected from the dropdown. Then center the cropped area on the portion of the picture you would like to be cropped. Click “apply” when finished.

4. To add the curved edges to the photo, select the icon that looks like a frame on the far left. Select the second option that this gives you, which is “Rounded Corners”. Drag the slider to the appropriate corner radius. Click apply when finished.

5. Save the photo by selecting the “Save” option at the top of the image viewing window.
